# DigiteX Voting — Client Briefing

**Operational status, step-by-step testing guide, and gap analysis vs the September 2026 Functional Specification**

**Integrale Plus / DigiteX**

**Audience:** School and university partners evaluating or testing the Elections and Voting module

**Date:** September 2026

**Related document:** DigiteX Voting Functional Specification (19 September 2026)

## 1. Purpose of this document

You asked for:

- A **detailed, step-by-step** explanation of the voting process (candidates, voters, voting, authentication, statistics, results).
- Clarity on **what is already operational** and **what is still under development**.
- Enough detail to **test the module confidently** before school or university deployment.

This document answers those points honestly.

### Important summary

| Item                                                                                                             | Reality today                                                            |
|------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| DigiteX Voting <b>Version 1</b>                                                                                  | Available and testable for <b>simple school elections</b> inside DigiteX |
| September 2026 Functional Spec (cycles, multi-electorate, standalone voters, ballot secrecy, turnout dashboards) | Describes <b>Version 2</b> — largely <b>not yet built</b>                |
| User manual section on Elections                                                                                 | Intentionally short because Version 1 is a <b>basic</b> module           |

Version 1 is useful for student council-style elections. It is **not yet** the full university multi-election cycle product described in the specification.

## 2. How Version 1 is structured (what exists in DigiteX today)

One Election (e.g. Student Council 2026)

- └─ Position 1 (e.g. President)
  - | └─ Candidates (must be DigiteX students)
- └─ Position 2 (e.g. Vice-President)
  - | └─ Candidates (must be DigiteX students)
- └─ Votes (one vote per student per position)

There is **no Electoral Cycle** layer yet.

There is **no separate voter register**. Eligible voters are DigiteX students of the same school who can log in.

## 3. Feature status matrix (Operational vs Under development)

### 3.1 Administration

| Feature                                          | Status      | Comment                                 |
|--------------------------------------------------|-------------|-----------------------------------------|
| List elections                                   | Operational | Elections menu (module must be enabled) |
| Create election (title, dates, academic session) | Operational | Starts as draft                         |
| Add positions (President, Delegate, etc.)        | Operational | Several positions per election          |
| Add candidates from DigiteX students             | Operational | By admission number                     |
| Remove candidate                                 | Operational |                                         |
| Publish election (open for student voting)       | Operational | Status becomes published                |

|                                                            |                          |                                                         |
|------------------------------------------------------------|--------------------------|---------------------------------------------------------|
| Close election                                             | <b>Operational</b>       | Status becomes completed                                |
| Electoral Cycle (campaign containing several elections)    | <b>Under development</b> | Spec Priority 1 — not in Version 1                      |
| Independent open/close/publish per election inside a cycle | <b>Under development</b> |                                                         |
| Eligibility rules (class, faculty, department, year group) | <b>Under development</b> | Today: all school students can see a published election |
| Independent candidates (not DigiteX students)              | <b>Under development</b> | Spec dual registration mode                             |
| Independent voters / CSV import                            | <b>Under development</b> |                                                         |
| Voting-only school (no full DigiteX student DB)            | <b>Under development</b> | Standalone mode                                         |
| SMS / WhatsApp to candidates or parents                    | <b>Under development</b> | Spec Priority 2                                         |
| Dedicated admin roles (registrar vs observer)              | <b>Partial</b>           | Uses DigiteX permissions; not election-specific roles   |

### 3.2 Voting and authentication

| Feature                                        | Status             | Comment                           |
|------------------------------------------------|--------------------|-----------------------------------|
| Student login → My Elections                   | <b>Operational</b> | Main voting path in Version 1     |
| Ballot with candidate name and photo           | <b>Operational</b> | Photo from student profile        |
| Confirm before casting vote                    | <b>Operational</b> |                                   |
| One vote per student per position              | <b>Operational</b> | Database unique constraint + lock |
| Block double vote after refresh / double-click | <b>Operational</b> |                                   |

|                                                                  |                          |                                                               |
|------------------------------------------------------------------|--------------------------|---------------------------------------------------------------|
| Participation receipt without naming the choice to third parties | <b>Partial</b>           | Student sees own confirmation; no parent SMS receipt yet      |
| QR / NFC identify API                                            | <b>Partial</b>           | Backend endpoints exist; no complete kiosk screen for schools |
| Voter ID / PIN / second factor after scan                        | <b>Under development</b> | Spec requirement                                              |
| Separate authentication for standalone voters                    | <b>Under development</b> |                                                               |

### 3.3 Statistics, secrecy, publication

| Feature                                           | Status                      | Comment                                                                    |
|---------------------------------------------------|-----------------------------|----------------------------------------------------------------------------|
| Count of candidates on election page              | <b>Operational</b>          | Basic                                                                      |
| Live turnout (registered / voted / not voted / %) | <b>Under development</b>    | Spec Priority 1                                                            |
| Results by candidate (votes and %)                | <b>Under development</b>    | No proper results publication screen yet                                   |
| Publish results only after close, by role         | <b>Under development</b>    |                                                                            |
| Exportable results report                         | <b>Under development</b>    | Spec Priority 2                                                            |
| Ballot secrecy (know who voted, not for whom)     | <b>Not met in Version 1</b> | Votes currently link voter and candidate — must be redesigned in Version 2 |
| Admin audit log (open / close / publish)          | <b>Under development</b>    |                                                                            |
| Notifications after publication                   | <b>Under development</b>    |                                                                            |

## 4. Mapping to your September 2026 specification

| Spec section                                        | DigiteX today                                                |
|-----------------------------------------------------|--------------------------------------------------------------|
| 2. Cycle → Elections → Positions                    | Only Elections → Positions                                   |
| 3.1 Create cycle and elections                      | Create election only                                         |
| 3.2 Candidate registration (DigiteX or independent) | DigiteX students only                                        |
| 3.3 Voter registration / import / filters           | Not available (all school students)                          |
| 3.4 Voting interface                                | Available for logged-in students                             |
| 3.5 Authentication (ID, QR, NFC + extra check)      | Login yes; QR/NFC partial; extra check no                    |
| 3.6 Statistics and publication                      | Not ready for production reporting                           |
| 5. Confidentiality / secrecy                        | Version 1 does not meet full secrecy design                  |
| Priority 1                                          | Partially covered (basic multi-position election + one vote) |
| Priority 2                                          | Mostly not started                                           |

## 5. Step-by-step: operate and test Version 1

Use this checklist on staging (for example [account.digitexvx.com](https://account.digitexvx.com)) or a pilot school before live deployment.

### 5.1 Prerequisites

- Institution (school) exists in DigiteX.
- Module **Elections** is activated for that school.
- Current **Academic Session** exists.
- Students exist and are enrolled.
- Each test voter has a **student user account** (can log in).
- Candidate students ideally have a **profile photo**.

## 5.2 Admin — create the election

- Log in as **School Admin** (or a role with election permissions).
- Open **Elections**.
- Click create / add election.
- Enter:
  - Title (example: Student Council Elections 2026)
  - Start date and time
  - End date and time (must be after start)
  - Academic session
  - Optional description
- Save. Status is **draft**.

## 5.3 Admin — add positions

- Open the election detail page.
- Click **Add position**.
- Create at least two positions for a realistic test, for example:
  - President
  - Vice-President
- Positions appear as sections of the ballot.

## 5.4 Admin — register candidates

- On a position, click **Add candidate**.
- Enter the student's **admission number** (matricule).
- Confirm the student is found and appears in the list.
- Repeat for each candidate on each position.
- Remove a candidate with the delete action if you made a mistake.

**Limitation:** you cannot add a candidate who is not already a DigiteX student.

## 5.5 Admin — publish (open voting)

- Check dates: “now” must be between start and end.
- Click **Publish**.
- Status becomes **published**.
- Students can now see the election under **My Elections**.

## 5.6 Student — vote

- Log in as a student user.
- Open **My Elections**.
- Select the published election.
- For each position:
  - Review candidate names and photos
  - Click vote
  - Confirm in the dialog
- After voting on a position, that choice is locked (cannot vote again for the same position).
- Complete all positions.

## 5.7 Admin — close

- When the voting period ends (or you want to stop voting), open the election.
- Click **Close**.
- Status becomes **completed**.
- Students should no longer cast new votes for that election.

## 5.8 What Version 1 does not include in this flow

- Selecting voters by class or faculty
- Importing an external voter list
- A live turnout dashboard
- An official results screen with percentages and export
- Proof that administrators cannot see who voted for whom (secrecy redesign)

- A finished NFC / QR voting booth experience for the school hall

## 6. Essential test cases from your specification

| Your test case                                                                          | Possible on Version 1? | How / why                                                         |
|-----------------------------------------------------------------------------------------|------------------------|-------------------------------------------------------------------|
| School using only Voting, no DigiteX student DB                                         | <b>No</b>              | Standalone mode not built                                         |
| School already on DigiteX reuses students                                               | <b>Yes</b>             | Candidates by admission number; voters = student logins           |
| University student votes President + Faculty + Year Delegate with different eligibility | <b>No</b>              | No cycle and no per-election electorate filters                   |
| Cannot vote twice (refresh, double-click, network retry)                                | <b>Yes</b>             | Test with one student on one position                             |
| Close one election while another in the same cycle stays open                           | <b>No</b>              | No cycle; create two separate elections as a weak workaround only |
| Admin sees participation without linking voter to choice                                | <b>No</b>              | Secrecy model not implemented                                     |

## 7. Recommended demonstration with Version 1 (what we can show now)

Until Version 2 is delivered, a fair demonstration is:

- Create **Student Council Elections 2026**.
- Add positions: **President** and **Vice-President**.
- Register 2-3 DigiteX students as candidates per position.
- Publish within an active date window.
- Have 3-5 student accounts vote.

- Prove a second vote on the same position is rejected.
- Close the election.

This proves Version 1 for **simple school elections**.

It does **not** yet prove the university multi-election cycle demo described in the specification (three elections with different eligible groups). That requires Version 2 development.

---

## 8. Proposed Version 2 roadmap (aligned with your Priority 1 and 2)

### Priority 1 — required for confident school / university deployment

- **Electoral Cycle** containing multiple elections.
- **Eligibility** per election (all students, class/year, faculty/department, or imported list).
- **Dual registration** (DigiteX database or independent candidates/voters).
- **Ballot secrecy** (participation record separate from ballot).
- **Turnout monitoring** and **results publication** with role rules.
- Independent open / close / publish per election.

### Priority 2 — after Priority 1

- Finished QR / NFC booth flow with anti-impersonation check.
- Notifications (SMS / WhatsApp) where configured.
- Advanced exports and dispute / lost-card procedures.
- Standalone Voting subscription packaging.

Security and ballot secrecy must be treated as **mandatory** in the first production-ready Version 2 release, as stated in your specification.

---

## 9. Practical recommendation for schools today

| Situation | Recommendation |
|-----------|----------------|
|-----------|----------------|

|                                                                                  |                                                                               |
|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| Primary / secondary student council, all students eligible, DigiteX already used | You may <b>pilot Version 1</b> with training using Section 5 of this document |
| University faculty / department / year-group elections                           | <b>Wait for Version 2</b> (eligibility + cycle)                               |
| Institution that wants Voting only, no full DigiteX SIS                          | <b>Wait for Version 2</b> (standalone registration)                           |
| Need official published results and secrecy guarantees                           | <b>Wait for Version 2</b>                                                     |

## 10. Next steps and your feedback

Please reply with your preference:

- ☐ Proceed with a **Version 1 pilot** in one school (simple council election), using this guide
- ☐ Prioritise **Version 2 Priority 1** development before any live election
- ☐ Both: short Version 1 pilot for training **and** Version 2 build plan with dates
- ☐ Need a **French** version of this briefing for local teams

**School / organisation:** \_\_\_\_\_

**Contact name:** \_\_\_\_\_

**Date:** \_\_\_\_\_
